

Manitou - QR - Data Entry - Creating a Restore Required Entry

Restore required indicates that the event programmed requires a restoring event before resetting the Zone status back to normal.

- To use the timeout feature, the customer record must have the checkbox "Generate Restore Overdues" enabled. This timeout tells the signal handler to generate a new alarm event, "Restore Overdue," if the applicable restoring event does not arrive within the prescribed time period.
- The Restore Command has two choices: Restore just restores the one event matching the zone, and Restore (Category) restores all zones within the selected event category.

PROGRAMMING RESTORE REQUIRED

1. Enter a new programming line within the customer record.
 2. Tab to the Commands Column, click the ellipsis button, locate the RestReq command, and double-click it to move it from the left-hand column to the right-hand column (see below).
 3. Select the restoring Event.
 4. Select the restoring Zone.
 5. If applicable, enter the timeout.
 6. Select the applicable Restored option.
 7. If applicable, select the Repeat checkbox.
 8. Click OK.
 9. If the restoring event is not within the same event category (such as Fire or Burglary), enter a new line of programming for the restoring event, then tab over to the Commands column and click the ellipsis button.
 10. Locate and move the Restore command from the left-hand column to the right-hand column.
 11. Click OK.
 12. Save the Record.
