

Alarm Handling - Escalate

The **Alarm Handling - Escalate** command allows the replacement and closure of the current alarm in lieu of a new escalated alarm.

The screenshot shows a software interface for handling an alarm. At the top, a blue header bar contains the text "Alarm Handling" and a downward-pointing arrow. Below this is a list of actions: "Defer", "Suspend", "Close", and "Escalate". The "Escalate" option is highlighted. Below the list are sections for "Entity Handling" and "Action Handling", each with a right-pointing arrow. The main configuration area is titled "Add Line 1" and includes two checkboxes: "Auto Run" and "Locked". Below these are three dropdown menus: "Escalate To" (set to "Alarm Customer"), "Event" (with a red error message "Required field. Invalid Event Code ."), and "Monitoring Group" (set to "="). At the bottom right, there are "CLEAR" and "APPLY" buttons.
