

Action Handling - Wait

The **Alarm Handling Wait** action is a rarely used task carried over from Manitou's Workflow functionality. Wait is a hold period, in seconds that delays the next action. This action is often used for actions that may be awaiting a response.

The screenshot shows a configuration window titled "Action Handling" with a dropdown arrow. The window contains a list of action types: "Wait", "Include", "Jump To", and "Label". Below this list is a section for "Add Line 1" with two checkboxes: "Auto Run" and "Locked". Underneath, there is a "Seconds" field with the value "1" entered.

Auto Run is encouraged for this action to allow Manitou to run the action pattern automatically.
