

Data Handling - Attention

The **Data Handling Attention** command, is not recommended for regular use in Action Patterns. An Attention is a passive delivery of information to an operator. This doesn't encourage understanding or properly execution of the information provided. When added to an Action Pattern, the Attention, is used for something that must be noted on every event that uses that command.

The screenshot shows a software interface titled "Data Handling" with a dropdown arrow. A list of commands is visible: Launch, Show, Attention, Prompt, Set, and Remark. Below the list is a section for adding a new line, labeled "Add Line 2". This section includes two checkboxes: "Auto Run" and "Locked". Below the checkboxes is a text input field containing the word "Attention". A red error message, "This field is required.", is displayed below the input field.
