

External Handling - Send and Connect

The **External Handling** commands of **Send** and **Connect** commands allow the connection to items monitored at the location.

Send uses Reverse Channel commands to connect to devices at the monitored location.

The screenshot shows a configuration window titled "External Handling" with a blue header. Below the header, there are two main sections: "Send" and "Connect", both highlighted in light gray. Below these is a "Logic Handling" section with a right-pointing arrow. The main configuration area is titled "Add Line 2" and includes several fields: "Transmitter" (set to "Communicator 1"), "Command" (with a dropdown arrow), "Command Text" (a text input field), "Route" (set to "Alarm's FEP/Rec/Line"), and "Retries" (an empty text input field). To the right of the "Add Line 2" title are two checkboxes: "Auto Run" and "Locked", both of which are unchecked. At the bottom right of the form are two buttons: "CLEAR" and "APPLY".

Connect selects and connects to devices configured on the monitored account.
