Application Corrections

Resolved Issues
Modified URS format is Not working as it was before update
When the option is enabled to modify the URS, it was only working when the first URS came in; it was not working for any subsequent URS. This issue has been resolved to modify all URS when the option is checked.
Ability to save and send Twilio
There were errors trying send out Twilio SMS texts. This error has been corrected error Twilio SMS now work as expected.
Temp Notes not showing in alarm
Temporary comments were not showing in the alarm as expected. This has been corrected so that the "to" date is recognized as being valid.
F12-Write Comments showing SMS details in History
When selecting to send to SMS from the F12-Write Comments, the details did not log in History the same as they would for email. It did not log the date/time stamp or the number contacted. This has been updated so that SMS messages sent via F12-Write Comments from a Priority Alarm screen will show the same details as email does in the History.
Contact ID Areas case sensitivity
When handling a zone, the program was not checking the case of the zone. This was causing the timer to reset on the lowercase s zone rather than the Uppercase S area. For example, it would always pull the first one in the list of 401S002 or 401s002. This has been corrected to look at the case of the zone.
